# Login & Account System asset for Unity

Current version: 0.6.4.3
Integrate the Login & Account System asset into your application to manage user access, connect them via the friend system, and use other features of [Xsolla Login](#).

[Try our demo to learn more](#).

Note:
Login & Account System asset is already included as part of the [Game Commerce](#) asset. You can download the Game Commerce if you need a broader set of features, but do **NOT** install these plugins separately.

For a better understanding of which Xsolla asset to choose, use the table:

	Game Commerce asset	**Login & Account System asset**	**Cross-Buy asset**
In-game store			
Virtual currency	+		
Virtual items	+		
Player inventory	+		+
Bundles	+		
Promotional campaigns	+		

Login			
Authentication	+	+	+
User management	+	+	+
Payment UI	+		
Additional features			
UI builder	+	+	+
Battle pass	+		

Requirements

System requirements

- 64-bit OS
- Windows 7 SP1 and later
- macOS 10.12 and later
- The version of Unity not earlier than 2019.4.19f1

Target OS

- iOS
- Android
- macOS
- Windows 64-bit

Additionally, the asset supports creating WebGL build to run your application in a browser.

Note:

We recommend you use the Mono compiler for desktop platforms as it's compatible with the provided in-game browser. If you use other browser solutions, you can use the IL2CPP compiler instead. To create game builds for Android, you can use either Mono or IL2CPP compilers.

Integration

Before you integrate the asset, you need to sign up to Publisher Account and set up a new project.
More instructions are on the Xsolla Developers portal.

Usage

To manage the features of Xsolla products, the asset contains a set of classes, methods, prefabs, etc. that let you make requests to the [Login API](#). Use the [tutorials](#) to learn how you can use the [asset methods](#).

Known issues

Conflict of multiple precompiled assemblies with Newtonsoft.json.dll

Issue description

The issue appears when importing the asset on Unity version 2020.3.10f1 and later. The following error message is displayed:

```
Multiple precompiled assemblies with the same name
Newtonsoft.json.dll included on the current platform. Only one
assembly with the same name is allowed per platform.
```

The conflict arises because the `Newtonsoft.json.dll` library is included in both the Unity Editor and the asset. The library is included in the versions 2020.3.10f1 and later of the editor. And the asset includes the library to support the earlier versions of Unity Editor.
Issue status: Investigating.

Workaround

1. Remove the `Newtonsoft.json.dll` library from the asset:
    a. Create a new Unity project.
    b. Install asset from [Unity Asset Store](#).
    c. Go to `Assets\Xsolla\Core\Browser\XsollaBrowser\Plugins` directory.
    d. Remove `Newtonsoft.Json.dll` and `Newtonsoft.Json.dll.mdb` files.
2. Restart Unity Editor.

Unable to resolve reference UnityEditor.iOS.Extensions.Xcode

Issue description

The issue appears when using External Dependency Manager on Unity version 2020.1.0f1 and later.
When building the application, an error message is displayed:

```
Assembly
'Packages/com.google.external-dependency-manager/ExternalDependencyMa
```

```
nager/Editor/Google.IOSResolver_v1.2.161.dll' will not be loaded due
to errors:
Unable to resolve reference 'UnityEditor.iOS.Extensions.Xcode'. Is
the assembly missing or incompatible with the current platform?
Reference validation can be disabled in the Plugin Inspector.
```
Issue status: Investigating.

Workaround

Install iOS Build Support module from Unity Hub.
